    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein search, using sw model

VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAMB1; or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IAMB1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IAMB1 also recognises the extracellular matrix glycoprotein
                                                                                                                                                               WPI;

                                                AAW25187-W25192 are peptides containing an LDV sequence or equivalent. The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Endoscopic irrigation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 1997-133793/13.

                                                                              Ş
                                                                                                                                                                                    The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha4betal. Integrins are cell surface receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only provide a binding site for the adenovirus penton base protein, but also mediate cellular adhesion to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the bispecific molecule is formed, and the cell is contacted with it to allow entry of the adenovirus into the cell. The methods can be used for research and the vectors can be used for gene therapy.

CC thrombus may form an occlusion of a blood vessel, in a subject comprises conditions may form an occlusion of a blood vessel, in a subject comprises candinistering a compound which dissociates fibrinogen bound to a first contend to a platelet glycoprotein IIb-IIIa, by binding to a second contended the steep of the platelet thrombus. The method is used to treat humans with unstable contended to enact de-adhesion of osteoclasts from the bone surface to halt come loss in a patient with osteoporosis. The methods can be used to enact de-adhesion of fosteoclasts from the bone surface to halt come loss in a patient with osteoporosis. The methods can also be used continuous of angiogenic endothelial cells in a patient with a contended with angiogenesis, e.g. cancer, diabetic retinopathy, psoriasis. The methods can also be used to treat tumours, condition associated with angiogenesis, e.g. arthritis, inflammatory conditions, and asthma. The methods can be used for the dissolution of pre-formed platelet aggregates, which is a constant of the current strategy of treatment prior to formation of the processor and interest an interest and intere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to integrin ligand dissociators. Disaggregation of an existing platelet thrombus in a blood vessel is due to dissociation of fibrinogen from glycoprotein IIb-IIIa. This dissociation is caused by the binding of an integrin-ligand dissociator at ligand binding site I of glycoprotein IIb-IIIa. The invention provides a method of disaggregating an existing platelet thrombus in a blood vessel, where the platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Integrin-ligand; dissociator; disaggregation; platelet thrombus; stro fibrinogen; glycoprotein IIb-IIIa; angina; myocardial infarction; bon osteoclast; osteoporosis; angiogenesis; cancer; diabetic retinopathy; psoriasis; tumour; atherosclerosis; inflammatory bowel disease; asthmorgan transplant rejection; arthritis; ILD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11-MAR-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 10; 39pp; English.

                                                                                                                                                                                                                                        7442
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and metalloprotease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold cabe designed to have a predetermined resorption/degradation rate, and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel system for reconstitution of osseous tissue comprising a scaffold carrying a compound (I) that promotes bone formation and a component that decreases bone resorption (II). Induces migration and adhesion of osteoblasts and osteoclasts and (II) inhibits proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selection or selection binding

(e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important acids to the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes; the cS-1 FN/VLA-4 interaction plays and the surface of leukocytes are surface of leukocytes and the surface of leukocytes and the surface of leukocytes and the surface of leu
                                                                                                  manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and otl skin inflammations, demyelinating diseases of the central nervous sys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptidomimetic compounds used expressing receptor and VLA-4 inhicardiovascular disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidominetics of the invention may be used to treat both chronic and acute immunoinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2000-182213/16.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanolc acid derivatives and related compounds (I), and their salts and prodrugs. These are are integrin inhibitors, specifically of VLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD49d/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-inducible cell surface protein VCAM-1 (vascular cell adhesion molecula-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and inflammatory bowel disease. Sequences AAX69618-Y69520 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              administration of at least one integrin antagonist. The integrin can antagonists that may be used in the method include antagonists of alpha-1-subunit containing integrins or antagonists of alpha-1-subunit containing integrins or antagonists are antibodies containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antiger-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, ce end-stage renal disease, chronic diabetic nephropathy, diabetic collagen IV, and the case of VLA-4). The method of the invention may be used to treat chronic renal failure, ce of stage renal disease, chronic diabetic nephropathy, diabetic collagen IV, and the collagen IV, a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a modified therapeutic peptide (I)
CC comprising a therapeutically active amino acid region (III) and a
CC reactive group (II) (e.g. succinimidy) and maleimido groups) attached to
CC a less therapeutically active amino acid region (IV), which covalently
CC bonds with amino/hydroxyl/thiol groups on blood components to form a
CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
CC factors and neurotransmitters, to protect them from peptidase activity
CC in vivo for the treatment of various disorders. Endogenous therapeutic
CC peptides are not suitable as drug candidates as they require frequent
CC administration due to rapid degradation by peptidases in the body.
CC Modifying and attaching therapeutic peptides to albumin prevents or
CC reduces the action of peptidases to increase length of activity (half
CI life) and specificity as bonding to large molecules decreases
CC lifes callular uptake and interference with physiological processes.
CC AAB90829 to AAB92441 represent peptides which can be used in the
CX exemplification of the present invention.

The polypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying agents as inhibitors of alpha4 integrin biological responses by contacting the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin or paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin biological response. Inhibitors of the binding of paxillin to alpha4 are useful in blocking immune responses in conditions such as inflammatory bowel disease, arthritis, multiple sclerosis and astuma and in
                                                                                                                                              07-DEC-2000

It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation, thromboate and mail transmembrane.
                                                                                                                                                                                                                                                                                                                                      Vascular cell adhesion molecule 1; integrin; fibronectin; in binding inhibitor; atherosclerosis; allergy; rheumatoid arth asthma; multiple sclerosis; type 1 diabetes; cancer; cyclic;

                                The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-be CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant the extracellular matrix protein fibronectin (FN). VLA-4 is express the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical to in the interaction of endothelial cells is also a

This invention describes a novel method for the cyclization of penta- of hexapeptides which is effected by reaction with propanesulfonic acid anhydride (I). The process is especially useful for cyclizing H-Phe-D-Trp-Ala-Thr(tbu)-Phe-Pro-OH to obtain the somatostatin agonist L-363,301, or for cyclizing H-Ile-Leu-Asp(Otbu)-Val-NH(CH_2)_5COOH. The process gives higher yields than prior art processes. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (e.g., multiple scierosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AX77434-Y77444 represent fragments of the CS-1 peptide tested for
                                                                                                                                         Claim
                                                                                                                                                                                                Cyclization of penta-
                                                                                                                                                                                                                                        WPI;

                                              active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAMO1703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cybs. of minimal length. A minimal essential sequence for specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. A generic peptidomimetic inhibits the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 3000-fold greater than the inhibition in the binding exhibited by AAWO1705. CS-1 mediated inflammation, e.g. astima, because the property of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           skin

                                                                                                                                                                                                                                                                                                        The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD49d/CD29) to the CS-1 portion (25 mmino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system
                                                                              (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptidomimetic compounds used as cell expressing receptor and VLA-4 inhibitors cardiovascular disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

The invention relates to peptidomimetic compounds (AAY77415-Y77438) CC capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of CC the extracelular matrix protein fibronectin (FN). VLA-4 is expressed on CC important role in the maturation and trafficking. VLA-4 mediated concerning the control of the CS-1 FN/VLA-4 interaction plays an CC important role in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics of the CC invention may be used to treat both chronic and acute immunoinflammatory CC conditions, such as asthma, rheumatoid arthritis, osteoarthritis and concerning the control of the control of the control of the central nervous system CC e.g., multiple sclerosis), allergies, atherosclerosis, colitis, CC diabetes, inflammatory bowel disease, kidney inflammation and control of the central nervous system CC involves the use of anti-VLA-4 antibodies, which can themselves induce an compared administration of the central central nervous and control of the central and control of the central and control of the central centra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

                                                            The present peptide is a specifically claimed example of a peptide which contains the highly generic sequence A85-AA4-AA3-AA2-AA1-(AAX)n where AA5 is Glu, Ser, A8p or Asn; AA4 is Leu or Ser, AA3 is Leu, Ile, Phe or Gly; AA2 is Asp, Leu, Asn or Ser; AA1 is Gly, Pro or Asp; AAX is any amino acid and n = 0 or 1. When two or more such peptides are attached to a carrier, the product can be used for stimulating adhesion of eukaryotic cells in vitro. Particular applications include coating synthetic blood vessels with endothelial cells, preparing skin grafts using epithelial cells or stimulating wound healing. When a single peptide is used it may inhibit intercellular adhesion, making it useful for preparation thrombootic or attached the set of the peptide is used it may inhibit intercellular adhesion, making it useful for preparation thrombootic or attached the set of the peptide 
it useful for preventing thrombosis or arteriosclerosis or to suppress cancer metastases. The peptides can also be used as chemotactic attractors and for detecting/quantifying cell-cell adhesion in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide(s) that stimulate or inhibit cell to cell adhesion e.g. to coat synthetic blood vessels with endothelial cells,

                                         tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-linding sites have been identified within fibronectin. One site is found in the Hepli region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AARS5704-805 are modeled after a portion of the CS1 peptide that include the LDV domain presented in such a way by its novel
                                                                                                                                                                                                                                            Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-deta-1 (IA4B1 or VCAM-1 very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR95716
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT
                                        Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the curriace of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-1 recognises and binds to the integrin of IAAB1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the citisue surrounding the capillary has been infected or damaged. Sometimes this white blood cells flooding to the scene, causling widespread tissue damage. Cpds. capable of blooding to the scene, causling widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IAAB1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IAAB1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IAAB1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 reputive that include the LDV domain presented in such a way by its novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                       CVCAM-1 recognises and binds to the integrin alpha-beta-1 (IABB); or
CVLA-4 for very late antigen-4), a heterodimeric protein present on the
CS surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows
CC white blood cells to adhere to the capillary wall in areas where the
CC tissue surrounding the capillary has been infected or damaged. Sometimes
CC this white blood cell migration can become uncontrolled, with white
CC closs capable of blocking this process may be beneficial as therapeutic
CC agents. IA4B1 also recognises the extracellular matrix glycoprotein
CC fibronectin. Three distinct IA4B1-binding sites have been identified
CC within fibronectin. One site is found in the HeplI region and is
CC expressed in all isoforms; two others (CS1 and CS5) are present in the
CC affinity for IA4B1 and contains the tripeptide LDV as its minimal active
CC affinity for IA4B1 and contains the tripeptide LDV as its minimal active

                                                                 RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a precursor peptide. The invention relates to cyclic peptides which block the interaction of protein ligand VCAM-1 (vascular cell adhesion molecule-1) to its integrin receptor VLA-4 (very late antigen-4), thereby modulating T-cell proliferation, B-cell localisation to germinal centres and adhesion of activated T-cells and eosinophils to endothelial cells. These peptides are thus of use in treating diseases associated with these processes, including rheumatoid arthritis, multiple sclerosis and asthma, melanoma cell invasion in metastasis, autoimmune diabetes, colitis, autoimmune encephalomyelitis, atherosclerosis, peripheral vascular or cardiovascular disease, nephritis, allograft rejection, psoriasis, restenosis, myocarditis, and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cyclic peptide; dimeric peptide; vascular cell adhesion molecule-1; VCAM-1; fibronectin; integrin; rheumatoid arthritis; asthma; multiple sclerosis; VLA-4; very late antigen-4; precursor.

                                                                                                                                                                                                                                                                                                                                                         the angiopoietins through cleavage by the proteases TPCK Trypsin or Staphylococcus aureus protease. The angiopoietins bind to the receptor tyrosine kinase Tie-2 which is upregulated during angiogenesis. Chapiopoietin 1 (Ang 1) is ubiquitously expressed and interacts with Tie-2 on endothelial cells and early haemopoletic cells. Angiopoietin 2 (Ang 2) is homologous to Ang 1 and competitively inhibits Ang 1 creating a blood supply to a tumour. The peptides are used in a compound that binds to sites of angiogenesis is the process involved in creating a blood supply to a tumour. The peptides are used in a compound that binds to sites of angiogenesis. The compound consists of a chelator moiety capable of complexing a radionuclide metal or a moiety capable of binding to a halogen group, and an angiogenesis targeting molecule. The peptides are incorporated in the angiogenesis targeting molecule. The compounds are used for imaging and treating angiogenesis, and also to detect, stage and treat tumours and metastases. Angiogenesis is also required for wound healing and conditions such as diabetic retinopathy, in the treatment of these conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transplant devices. The biomaterials are also userul transplant devices. The biomaterials are also userul transplant devices. The biomaterials are also userul transplant devices in the active demands of adhesion-promoting peptides have been identified as being the active domains of adhesion-promoting proteins such as fibronectin, vitronectin, laminin, collagen, von Willebrand factor osteonectin etc. These peptides can be incorporated into the biomaterial when they are designed with a strong nucleophile in the peptide chain such as cysteine. These peptides are potentially useful in controlling a variety of cellular reactions such as cell attachment, migration and overgrowth on a material surface when the material is non bio-degradable or slowly degradable, and cell migration through a material when that material is biodegradable.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  unsaturated bond or a conjugated unsaturated group, by nucleophilic addition. The polymeric hydrogels can be used in a variety of applications. They can be used to deliver therapeutic molecules to a subject, as adhesives or sealants (e.g. sealing air leaks on the lung), as tissue engineering and wound healing scaffolds, and as cell transplant devices. The biomaterials are also useful for adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reactive group (II) (e.g. succinimidyl and maleimido groups) attached a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growt.
                                                                                                 Oligopeptide and polypeptide compsns. based on the amino acid sequence of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
               The alpha-4 beta-1 (CD49d/CD29, VLA-4) cell adhesion receptor is an active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAW01703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds. of minimal length. A minimal essential sequence for specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. A generic peptidomimetic inhibits the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 300-fold greater than the inhibition in the binding exhibited by AAW01705. CS-1 mediated inflammation, e.g. asthma, rheumatoid arthritis, osteoarthritis, allograft rejection, skin
                                                                                                                                                                                                                                                                                                                                                                                  New peptide mimics of fibronectin CS-1 sequence - in interaction of endothelial cells and VLA-4 carrying cells, for treating or preventing asthma, arthritis

                                                                                                        Single strand conformation polymorphism analysis revealed a conformer in the sodium channel gene, domain IV, segment 53, in horses affected by hyperkalemic periodic paralysis. A C to G transversion (AAQ75256) was present in 5/18 sequenced clones from the horse. The sequence found in unaffected horses is given in
                                                                                                                                                                                  Detecting hyperkalaemic periodic paralysis in horses identifying a single base mutation in the skeletal muchannel gene, can be used for prenatal diagnosis.
                                                                                                                                                                                                                                                                                                           01-OCT-1992;

                                                                                                                                                                      CC vascular cell adhesion molecule-1 (VCAM-1) is protein found on the CC surface of endothelial cells that line the interior wall of capillaries. CC vCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC what for very late antigen-4), a heterodimeric protein present on the Surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows CC white blood cells to adhere to the capillary wall in areas where the CC tissue surrounding the capillary has been infected or damaged. Sometimes CC this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, caussing widespread tissue damage. CC to capable of blocking this process may be beneficial as therapeutic CC agents. IA4B1 also recognises the extracellular matrix glycoprotein CC fibronectin. Three distinct IA4B1-binding sites have been identified CC within fibronectin. One site is found in the Hepli region and is CC expressed in all isoforms; two others (CS1 and CS5) are present in the CC affinity for IA4B1 and contains the tripeptide LDV as the minimal active Site. Peptides AAR95704-805 are modeled after a portion of the CS1 CC flanking sequence to produce a potent inhibitor of IA4B1 binding.

                                                                                                                                                                                                 Cpds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains, the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             VCAM-1; vascular cell adhesion molecule-1; VLA-4; very late antigen-4; inhibitor; binding; white blood cell; migration; capillary wall; tissue damage; injury; fibronectin; extracellular matrix glycoprotein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometithis white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide(s) based on the LDV domain of fibronectin - unhibiting binding of alpha-4, beta-1 integrin to VCAM-1, fibronectin or invasin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic
